USDL 06-1972 TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EST), TUESDAY,

**November 14, 2006** 

# **Producer Price Indexes – October 2006**

The Producer Price Index for Finished Goods fell 1.6 percent in October, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This decrease followed a 1.3-percent decline in September and a 0.1-percent advance in August. At the earlier stages of processing, prices received by manufacturers of intermediate goods moved down 1.1 percent in October after falling 1.4 percent in September, and the crude goods index dropped 10.5 percent following a 3.4-percent decrease in the previous month. (See table A.)

Table A. Monthly and annual percent changes in selected stage-of-processing price indexes, seasonally adjusted

			Finished	l goods

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for June 2006 have been revised to reflect the availability of late reports and corrections by respondents.

Among finished goods in October, prices for goods other than foods and energy declined 0.9 percent after rising 0.6 percent in September. The index for finished consumer foods also turned down—falling 0.8 percent in October following a 0.7-percent increase in the prior month. Conversely, prices for energy goods decreased 5.0 percent after dropping 8.4 percent in September.

Before seasonal adjustment, the Producer Price Index for Finished Goods moved down 1.2 percent in October to 158.4 (1982 = 100). From October 2005 to October 2006, finished goods prices declined 1.6 percent. Over the same period, the index for finished energy goods fell 10.4 percent, prices for finished consumer foods climbed 1.5 percent, and the index for finished goods other than foods and energy increased 0.6 percent. At the earlier stages of processing, prices received by intermediate goods producers rose 0.4 percent, while the crude goods index decreased 22.0 percent for the 12 months ended in October.

# Finished goods

The index for finished goods other than foods and energy declined 0.9 percent in October after rising 0.6 percent in September. Prices for light motor trucks fell 9.7 percent following a 3.5-percent gain in the preceding month. From October 2005 to October 2006, the index for light motor trucks dropped 12.4 percent. Passenger car prices moved down 2.3 percent in October compared with a 2.8-percent advance a month earlier. For the 12 months ended October 2006, the passenger cars index decreased 3.2 percent. In accordance with usual practice, most new-model-year passenger cars and light motor trucks were introduced into the PPI in October. (See *Report on Quality Changes for 2007 Model Vehicles*, USDL 06-1973.) Prices for communication and related equipment, soaps and synthetic detergents, alcoholic beverages, x-ray and electromedical equipment, and printing trades machinery declined in October after increasing in September. The mobile homes index was unchanged following an advance in the prior month, and prices for cosmetics and other toilet preparations rose less than in September. Alternatively, the index for pharmaceutical preparations climbed 0.5 percent after falling 0.2 percent in the previous month. Prices for household appliances, tires, and household furniture also turned up in October. The indexes for sporting and athletic goods and for commercial furniture increased more than they had in September. (See table 2.)

Prices for finished consumer foods decreased 0.8 percent in October following a 0.7-percent increase in the prior month. The pork index fell 10.2 percent after rising 8.1 percent in September. Prices for fresh and dry vegetables, beef and veal, and soft drinks also declined in October following advances a month earlier. The indexes for dairy products, finfish and shellfish, and processed fruits and vegetables increased less than they had in September, while prices for processed young chickens decreased more in October than in the previous month. Conversely, the index for confectionery end products fell 0.2 percent after moving down 2.6 percent in September. Prices for fresh fruits and melons and for processed turkeys turned up, while the indexes for bakery products and roasted coffee climbed in October after remaining unchanged in the preceding month.

The index for finished energy goods declined 5.0 percent in October following an 8.4-percent drop in September. Gasoline prices decreased 7.9 percent after dropping 22.2 percent a month earlier. The indexes for liquefied petroleum gas and diesel fuel also fell less than they had in September. Prices for home heating oil and kerosene turned up in October. By contrast, the index for residential natural gas declined 9.3 percent following a 1.8-percent advance in September. Prices for residential electric power fell more in October than they had in the previous month.

# **Intermediate goods**

The Producer Price Index for Intermediate Materials, Supplies, and Components fell 1.1 percent in October following a 1.4-percent decline in September. Prices for intermediate energy goods decreased less than they had in the prior month. The index for nondurable manufacturing materials turned up after falling in September. By contrast, prices for materials for durable manufacturing and for materials and components for construction turned down following advances a month earlier. The index for intermediate foods and feeds increased less than it had in the previous month. Excluding foods and energy, prices for intermediate goods were unchanged in October after edging up 0.1 percent in September. (See table B.)

The index for intermediate energy goods decreased 5.5 percent in October following a 7.5-percent decline in September. Prices for diesel fuel fell 8.9 percent after dropping 22.3 percent a month earlier. The indexes for gasoline and jet fuel also declined at slower rates than in the previous month. Prices for home heating oil and commercial electric power turned up in October. By contrast, the index for industrial natural gas decreased 12.3 percent after advancing 0.7 percent in September. Prices for commercial natural gas and natural gas to electric utilities also turned down in October. (See table 2.)

Prices for materials for nondurable manufacturing edged up 0.2 percent in October subsequent to a 1.5-percent decrease in September. The index for finished fabrics increased 0.6 percent compared with a 0.2-percent decline in the previous month. Prices for primary basic organic chemicals decreased less in October than a month earlier, while the index for plastic resins and materials moved up after no change in September. Conversely, the index for nitrogenates moved down 1.8 percent in October after increasing 4.5 percent in September. The index for intermediate basic organic chemicals declined more than it had in the prior month. Paper prices were unchanged in October following increases in the previous month. The index for stemmed and redried tobacco fell after no change in September, and prices for paint materials rose less than in the prior month.

The index for materials for durable manufacturing inched down 0.1 percent in October compared with a 0.5-percent advance in September. Prices for hot rolled steel sheet and strip fell 2.2 percent subsequent to a 1.1-percent rise a month earlier. The indexes for cold rolled steel sheet and strip and for hot rolled steel bars, plates, and structural shapes increased at slower rates than in September. By contrast, the index for primary aluminum (except extrusion billet) rose 5.6 percent after declining 2.1 percent in September. Prices for cold finished steel bars were unchanged after declining in the prior month. The index for hardwood lumber edged up following a decrease in September, and prices for titanium mill shapes increased more than in the preceding month.

Prices for materials and components for construction declined 0.2 percent in October subsequent to a 0.2-percent advance in September. The softwood lumber index decreased 6.8 percent in October compared with a 0.7-percent increase a month earlier. Prices for treated wood and for air conditioning and refrigeration equipment also moved down following September gains. The indexes for steel mill products and for asphalt felts and coatings rose less than they had in the preceding month. The index for millwork declined in October after no change a month earlier. By contrast, prices for concrete products advanced 0.2 percent after falling 0.4 percent in September. The index for fabricated structural metal products moved up after remaining unchanged in the prior month.

Prices for intermediate foods and feeds rose 0.4 percent in October following a 0.8-percent advance in September. In October, rising prices for prepared animal feeds; flour; fluid milk products; and dry, condensed, and evaporated milk products more than offset declining prices for pork; beef and veal; processed young chickens; natural, processed, and imitation cheese; shortening and cooking oils; and refined sugar and byproducts.

# Crude goods

The Producer Price Index for Crude Materials for Further Processing fell 10.5 percent in October after decreasing 3.4 percent in September. Prices for crude energy materials fell more than they had in the previous month. The basic industrial materials index turned down in October after increasing a month earlier. Conversely, prices for crude foodstuffs and feedstuffs rose more than they had in September. (See table B.)

The crude energy materials index dropped 23.5 percent in October following an 8.4-percent decline in the previous month. Prices for natural gas plummeted 39.6 percent after falling 5.5 percent in September. The index for coal edged up 0.1 percent after advancing 0.2 percent in the preceding month. By contrast, price declines for crude petroleum slowed from 13.3 percent in September to 9.4 percent in October. (See table 2.)

Prices for crude nonfood materials less energy decreased 1.3 percent after advancing 1.0 percent a month earlier. The iron and steel scrap index turned down 2.7 percent following a 5.0-percent increase in September. Aluminum base scrap prices also fell in October after rising in the previous month. The indexes for wastepaper and for construction sand, gravel, and crushed stone increased less than they had in September. Prices for copper base scrap and gold ores decreased more than they had in the preceding month. Conversely, the decline in the raw cotton index slowed to 0.6 percent from 2.0 percent a month earlier. Prices for hides and skins turned up after decreasing in September.

The crude foodstuffs and feedstuffs index increased 3.1 percent following a 2.3-percent rise in September. Corn prices jumped 32.7 percent after a 1.0-percent advance in the preceding month. The indexes for wheat and slaughter turkeys also rose more in October than they had in September. Prices for soybeans turned up following declines in the previous month. By contrast, slaughter cattle prices fell 1.1 percent after a 3.0-percent increase in the preceding month. The indexes for slaughter hogs and for fresh and dry vegetables also turned down following advances a month earlier. Prices for slaughter broilers and fryers fell more in October than they had in the previous month.

# Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries fell 16.4 percent in October after declining 7.4 percent in the preceding month. (Net output price indexes are not seasonally adjusted.) Prices received by the oil and gas extraction industry group moved down 24.7 percent following a 9.8-percent decrease in September. The industry index for gold ore mining also fell more than in the prior month. Prices paid to the industries for crushed and broken limestone mining and quarrying and for bituminous coal and lignite surface mining turned down after increasing a month earlier. The industry index for oil and gas operations support activities rose less than in September. Conversely, declines in prices received for oil and gas well drilling slowed to 2.3 percent in October from 4.9 percent in the previous month. The industry index for bituminous coal underground mining turned up after decreasing in September, and prices received by the industry for crushed and broken granite mining and quarrying rose more than a month earlier. In October, the Producer Price Index for Total Mining Industries was 172.6 (December 1984 = 100), 32.1 percent below its year-ago level.

Manufacturing. The decline in the Producer Price Index for the Net Output of Total Manufacturing Industries slowed to 0.6 percent in October from 1.9 percent a month earlier. Prices received by the petroleum and coal products manufacturing industry group fell 5.7 percent after decreasing 16.2 percent in September. The industry group index for plastics and rubber products turned up after falling in the prior month, and prices received by the machinery manufacturing industry group rose more than in September. Alternatively, the increase in the industry group index for transportation equipment slowed to 0.3 percent in October from 0.9 percent a month earlier. Prices received by the industry groups for food manufacturing, wood product manufacturing, computer and electronic product manufacturing, and for beverage and tobacco product manufacturing turned down after rising in September. In October, the Producer Price Index for Total Manufacturing Industries was 155.8 (December 1984 = 100), 0.5 percent below its year- ago level.

**Services.** Among services in October, higher prices were received by the industries for general medical and surgical hospitals, scheduled passenger air transportation, engineering services, offices of physicians, portfolio management, and for investment banking and securities dealing. Alternatively, lower prices were received by the industries for commercial banking; non-casino hotels and motels; lessors of nonresidential buildings (except miniwarehouses); and long distance, less than truckload, general freight trucking.

\*\*\*\*

Producer Price Index data for November 2006 are scheduled to be released on Tuesday, December 19, 2006, at 8:30 a.m. (EST).

## **Brief Explanation of Producer Prices Indexes**

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the construction, trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes, (2) commodity indexes, and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

# **Stage-of-Processing Indexes**

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

#### **Commodity Indexes**

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (two-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (three-digit codes), product classes (four-digit codes), subproduct classes (six-digit codes), and individual items (eight-digit codes). Nearly all eight-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

#### **Industry Net-Output Price Indexes**

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digit codes), products (9-digit codes), and more detailed subproducts (11-digit codes); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product categories. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products make up a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products—for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

#### **Data Collection**

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms also are chosen by probability proportionate to size. BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of actual prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

Title	Code	PPI Detailed Report Issue

# Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including values of shipments between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct for this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

#### **Price Index Reference Base**

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982 = 100. From 1971 through 1987, the standard reference base for most PPI series was 1967 = 100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at **www.bls.gov/opub/hom/homch14\_itc.htm**. Reprints are available on request.

## **Calculating Index Changes**

Each PPI measures price changes from a reference period that equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

## Index point change

Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index navagut abanga	
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034

0.034 x 100

Result multiplied by 100

Equals percent change

# **Seasonally Adjusted and Unadjusted Data**

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. For more information, see *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, on the Web at www.bls.gov/ppi/ppiescalation.htm. Reprints are available on request.

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year, the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is reevaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or an aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than does the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (six-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if the pattern keeps shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products, but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 were subject to intervention in 1997.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

#### **Producer Price Index Data on the Internet**

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, use of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million instances of PPI series being downloaded from the Internet during the 12 months ended December 31, 2003.

#### Retrieving PPI data from the PPI Web site

PPI data can be obtained from the WWW address (**www.bls.gov/ppi**). Scrolling down the page to the "Get Detailed PPI Statistics" header reveals the following methods of data retrieval:

- *Most Requested Series* is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- *Create Customized Tables* is a form-based query application designed for users unfamiliar with the PPI coding structure. The application guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple-screen, non-Java-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.
- Series Report is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at a time.

There are five alphabetic prefixes used to create unique PPI time series identifiers: WP, WD, PC, PD, and ND. Each provides the user access to a different PPI database. Adding either a "u" (not seasonally adjusted) or an "s" (seasonally adjusted) to the end of these prefixes further specifies the type of data needed.

For commodity and stage-of-processing indexes, series identifiers combine a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) with a commodity code.

Commodity code Provides data for:

wps141101 Passenger cars, seasonally adjusted wpu141101 Passenger cars, not seasonally adjusted wpusop3000 Finished goods, not seasonally adjusted

For discontinued commodity indexes, series identifiers combine a "wdu" prefix (not seasonally adjusted) or a "wds" prefix (seasonally adjusted) with a commodity code.

Commodity code Provides data for:

wds019 Other farm products, seasonally adjusted

wdu0635 Preparations, ethical (prescription), not seasonally adjusted wdusi138011 Stainless steel mill products, not seasonally adjusted

Current price indexes grouped by industry according to NAICS have series identifiers that begin with the prefix "pcu." After the prefix, there are 12 digits (the 6-digit industry code is listed twice) followed by up to 7 alphanumeric characters identifying product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code, current NAICS series Provides data for:

pcu325---325--- Chemical manufacturing, not seasonally adjusted pcu336110336110 Automobile and light duty motor vehicle manufacturing

pcu621111621111411 Offices of physicians, one- and two-physician practices and single-specialty group

practices, general/family practice

pcu325412325412A Pharmaceutical preparation manufacturing, pharmaceuticals acting on the respiratory

svstem

Discontinued industry-product codes based on SIC combine a "pdu" prefix and "#" between the fourth and fifth characters of the product code. Series identifiers for the discontinued dataset use underscores as placeholders to complete a reference to an SIC industry group code of fewer than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of NAICS.)

Industry-product code, discontinued SIC series

Provides data for:

pdu28\_\_# Chemicals and allied products, not seasonally adjusted

pdu331\_# Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted

pdu3711#111 Passenger cars

Price indexes for discontinued series grouped by industry according to NAICS have identifiers that begin with the prefix "ndu." After the prefix, there are 12 numeric digits (the 6-digit industry code is listed twice), and up to 7 additional alphanumeric characters that identify product detail. Dashes are used as placeholders for higher-level industry group codes.

Industry-product code, discontinued NAICS series

ndu212231212231214

Provides data for:

ndu212231212231 ndu2122312122312

Lead ore and zinc ore mining Lead and zinc concentrates Lead concentrates

• *Flat Files* and the FTP server are best suited for users requiring access to either a large volume of time series data or other PPI-related documentation (such as seasonal factor and relative importance tables). The FTP site can be accessed at <a href="ftp://ftp.bls.gov">ftp://ftp.bls.gov</a> or directly from the links on the "Get Detailed Statistics" page or the PPI homepage. Data and documentation available for download include the following:

Directory:

NAICS series, current

NAICS series, discontinued

SIC series, discontinued

Commodity series, current

Commodity series, discontinued

Special requests

Commodity series

Co

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, the overview.txt file contains an overview relating to all BLS data available through the FTP site. For current commodity-based PPI data, the program help file is wp.txt; for discontinued commodity series, wd.txt; for current industry-based PPI data based on NAICS, pc.txt; for industry-based SIC time series that have been discontinued, pd.txt; and for industry-based NAICS series that have been discontinued, nd.txt.

Users who prefer downloading PPI datasets as individual ZIP files should go to the directory labeled /pub/time.series/compressed/tape.format/ on the FTP site. This directory includes six PPI-specific ZIP files, one for each of the PPI databases—WP, WD, PC, ND, and PD—and a ZIP file for the annual 5-year revision to historical seasonal PPIs.

#### Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (www.bls.gov). Clicking on the "Get Detailed Statistics" link at the top of the homepage calls up a chart listing all available BLS programs. The following methods are available for retrieving PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page, including economic news releases, series report, and economy at a glance.

#### Additional information

The PPI homepage (www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information at (202) 691-7705 or ppi-info@bls.gov.

<sup>1/</sup> Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

Note: NAICS 2002 replaced the SIC system beginning with the release of PPI data for January 2004.

<sup>2/</sup> The indexes for June 2006 have been recalculated to incorporate late reports and corrections by respondents. All indexes are subject to revision 4 months after original publication.

<sup>3/</sup> Not available.

Table 5. Producer price indexes by stage of processing, seasonally adjusted (1982=100)

			Inde	x 1/
