USDL 05-1294 TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, July 15, 2005

Producer Price Indexes -- June 2005

The Producer Price Index for Finished Goods showed no change in June, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This index had fallen 0.6 percent in May and risen 0.6 percent in April. At the earlier stages of processing, prices received by manufacturers of intermediate goods advanced 0.1 percent in June, following a 0.7-percent decline in the preceding month, while the crude goods index decreased 3.3 percent, after moving down 2.0 percent in May. (See table A.)

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for February 2005 have been revised to reflect the availability of late reports and corrections by respondents.

Among finished goods, the index for energy goods increased 2.0 percent in June, following a 3.5percent drop in the previous month. By contrast, prices for finished consumer foods fell 1.1 percent, compared with a 0.3-percent decline in May, and the index for finished goods other than foods and energy decreased 0.1 percent in June, following a 0.1-percent rise a month earlier.

During the first 6 months of 2005, prices for finished goods advanced at a seasonally adjusted annual rate (SAAR) of 2.4 percent, after moving up at a 4.8-percent SAAR during the latter half of 2004. Within the finished goods category, the index for finished energy goods increased at an 8.5-percent SAAR from December 2004 to June 2005 after rising at an 18.0-percent SAAR from June 2004 to December 2004, and prices for finished consumer foods went down at a 1.3-percent SAAR during the first half of 2005 after advancing at a 1.6-percent SAAR during the second half of 2004. The index for finished goods other than foods and energy climbed at a 2.2 percent SAAR in June 2005, the same rate of increase as in the prior 6-month period. At the earlier stages of processing, prices for intermediate goods increased at a 4.2-percent SAAR from December 2004 to June 2005, after rising at an 8.0-percent SAAR from June 2004 to December 2004. The crude goods index declined at a 3.4-percent SAAR during the first 6 months of 2005, after moving up at a 7.2-percent SAAR during the last 6 months of 2004. (See summary table below.)

Summary of December-to-December, 6-month, and 3-month seasonally adjusted annual rates for selected	ed.
stages of processing	

NOTE: Late reports and corrections by respondents may cause some indexes to change 4 months after original publication. In addition, seasonally adjusted indexes may be revised for 5 years due to the recalculation of seasonal factors each January.

Before seasonal adjustment, the Producer Price Index for Finished Goods declined 0.1 percent in June to 154.0 (1982=100). From June 2004 to June 2005, prices for finished goods advanced 3.6 percent. Over the same period, the index for finished energy goods jumped 13.2 percent, prices for finished goods other than foods and energy rose 2.2 percent, and the index for finished consumer foods inched up 0.1 percent. For the 12 months ended June 2005, prices for intermediate goods increased 6.2 percent and the crude goods index moved up 1.7 percent.

Finished goods

The index for finished energy goods climbed 2.0 percent in June, following a 3.5-percent decrease in May. Over two-thirds of this upturn can be traced to gasoline prices, which went up 8.7 percent in June compared with a 9.9-percent drop a month earlier. The indexes for home heating oil, liquefied petroleum gas, diesel fuel, and kerosene also advanced, after falling in May. Alternatively, prices for residential natural gas declined 3.2 percent in June, following a 0.9-percent decrease in the preceding month. The index for residential electric power also fell at a faster rate than it did in the previous month. (See table 2.)

-4-

The index for finished consumer foods declined 1.1 percent in June, compared with a 0.3-percent decrease in May. Prices for beef and veal dropped 8.0 percent in June, after rising 1.9 percent a month earlier. The indexes for fresh fruits and melons, eggs for fresh use, and for finfish and shellfish also moved down, following increases in May. Pork prices decreased in June, after remaining unchanged in the prior month. The index for processed turkeys fell at a faster rate than it did in May. By contrast, prices for fresh and dry vegetables advanced 7.4 percent in June, subsequent to a 15.0-percent decline in the preceding month. The dairy products index decreased less in June than it did in the previous month, while prices for roasted coffee and for processed fruits and vegetables rose more than they did in May.

The capital equipment index fell 0.2 percent in June, after inching up 0.1 percent in May. Prices for construction machinery and equipment moved down 0.4 percent in June, following a 2.2-percent jump a month earlier. The indexes for civilian aircraft and industrial material handling equipment also turned down, after rising in May. Prices for light motor trucks and passenger cars declined more in June than they did in the previous month, while the index for heavy motor trucks increased at a slower pace than it did in May. Conversely, prices for electronic computers decreased 0.8 percent in June, compared with a 4.8-percent drop in the preceding month. The indexes for railroad equipment and metal cutting machine tools advanced more than they did in May. From December 2004 to June 2005, capital equipment prices moved up at a 1.5-percent SAAR, after climbing at a 2.6-percent SAAR from June 2004 to December 2004.

The index for finished consumer goods other than foods and energy edged down 0.1 percent in June, following a 0.1-percent increase in May. Passenger car prices declined 1.0 percent in June after decreasing 0.2 percent a month earlier, while the index for light motor trucks fell 1.7 percent after moving down 0.9 percent in May. Prices for cigarettes and household furniture were unchanged in June, following advances in the preceding month. The indexes for periodical circulation and textile housefurnishings turned down, after rising in May. Prices for mobile homes and pharmaceutical preparations increased less in June than they did in the prior month. By contrast, newspaper circulation prices, which were unchanged in May, went up 1.7 percent in June. The book publishing index also rose after showing no change in the previous month, while tire prices advanced at a quicker pace than they did in May. During the first half of 2005, the index for finished consumer goods other than foods and energy climbed at a 2.6-percent SAAR, after moving up at a 2.1-percent SAAR during the second half of 2004.

Intermediate goods

The Producer Price Index for Intermediate Materials, Supplies, and Components edged up 0.1 percent in June, following a 0.7-percent decline in the prior month. Prices for intermediate energy goods rose, after decreasing in May, accounting for most of this upturn. Prices for materials and components for construction also turned up in June, while the index for materials for durable manufacturing fell less than it did in the preceding month. By contrast, the indexes for materials for nondurable manufacturing and for intermediate foods and feeds decreased, following increases in the previous month. Prices for intermediate goods other than foods and energy moved down 0.2 percent in June, compared with a 0.3-percent decline in May. (See table B.)

The intermediate energy goods index turned up 1.9 percent in June, after falling 2.6 percent in the preceding month. Gasoline prices jumped 8.7 percent, following a 9.9-percent drop in May. The indexes for jet fuels, diesel fuel, home heating oil, and liquefied petroleum gas also went up, after falling a month earlier. Prices for industrial electric power rose at a quicker pace than they did in May. Alternatively, the industrial natural gas index declined 5.1 percent in June, following a 1.5-percent decrease in the prior month. Prices for commercial natural gas also fell more than they did in May, and the index for commercial electric power turned down in June. Prices for intermediate energy goods advanced at an 11.9-percent SAAR during the first half of 2005, after rising at an 18.3-percent SAAR in the second half of 2004. (See table 2.)

The index for materials for durable manufacturing declined 0.5 percent in June, after falling 1.4 percent in May. Hot rolled steel sheet and strip prices fell 7.6 percent in June, after posting an 8.4-percent decline a month earlier. The indexes for building paper and board and for plywood turned up in June, while prices for copper cathode and refined copper, copper and brass mill shapes, and cement increased more than they did in May. By contrast, the aluminum mill shapes index turned down 1.6 percent in June, compared with a 0.3-percent advance in the preceding month. Prices for hot rolled steel bars plates and structural shapes; cold finished steel bars; and prepared paint also decreased, following gains in May. From December 2004 to June 2005, the index for materials for durable manufacturing fell at a 0.1-percent SAAR, after moving up at a 14.4-percent SAAR in the previous 6-month period.

Subsequent to a 0.2-percent decline in May, prices for materials and components for construction climbed 0.3 percent in June. Accounting for more than half of this upturn, the index for softwood lumber increased 3.9 percent, after falling 5.7 percent in the previous month. Prices for plywood, building paper and board, nonferrous wire and cable, and wiring devices also rose in June, following decreases in the prior month. The treated wood index went up more than it did in May. By contrast, prices for plastic construction products declined 0.7 percent in June, after increasing 0.6 percent in the preceding month. The indexes for paving mixtures and blocks, concrete products, and hardwood lumber also turned down in June, while prices for steel mill products fell more than they did in May. During the first half of 2005, the index for materials and components for construction advanced at a 4.5-percent SAAR, after increasing at a 5.7-percent SAAR in the second half of 2004.

Prices for materials for nondurable manufacturing turned down 0.4 percent in June, after inching up 0.1 percent a month earlier. Much of this downturn can be attributed to the index for plastic resins and materials, which fell 2.8 percent following a 0.4-percent rise in May. Prices for inedible fats and oils, finished fabrics, and paint materials also declined in June, after moving up in the prior month. The paperboard index decreased, following no change in May. Prices for intermediate basic organic chemicals fell more in June than they did in the previous month, and the index for basic inorganic chemicals rose less than in May. Alternatively, prices for primary basic organic chemicals showed no change in June, following a 3.1-percent drop in the preceding month. The indexes for paper, medicinal and botanical chemicals, and synthetic rubber increased more than they did in the preceding month. From December 2004 to June 2005, prices for materials for nondurable manufacturing climbed at a 3.9-percent SAAR, after rising at a 15.5-percent SAAR from June to December 2004.

The intermediate foods and feeds index declined 0.8 percent in June, following a 0.4-percent rise in the prior month. Leading this downturn, beef and veal prices dropped 8.0 percent, after moving up 1.9 percent in May. The index for fluid milk products also turned down in June. Prices for pork fell, following no change in May, while the flour index rose less than it did in the previous month. Conversely, the index for prepared animal feeds increased 2.0 percent in June, after rising 0.7 percent a month earlier. The natural, processed, and imitation cheese index fell less than it did in the preceding month, while prices for refined sugar and byproducts, shortening and cooking oils, and confectionary materials turned up in June. The index for intermediate foods and feeds advanced at a 2.9-percent SAAR in the first half of 2005, after falling at a 16.6-percent SAAR in the prior 6-month period.

Crude Goods

The Producer Price Index for Crude Materials for Further Processing declined 3.3 percent in June, following a 2.0-percent fall in May. Prices for crude foodstuffs and feedstuffs, crude energy materials, and basic industrial materials fell more in June than they did in May. (See table B.)

The crude foodstuffs and feedstuffs index declined 3.1 percent in June, after decreasing 1.0 percent in May. In June, prices for slaughter cattle fell 5.9 percent, following a 1.2-percent decline in May. Similarly, prices for slaughter hogs also fell at a faster pace, compared to May. The fresh fruits and melons, wheat, and unprocessed finfish indexes turned down in June after rising a month earlier. Conversely, prices for fresh vegetables (except potatoes) moved up 12.1 percent in June, following an 18.0-percent drop in the prior month. Prices for slaughter broilers and fryers and for corn also increased, after declining in the previous month. The index for crude foodstuffs and feedstuffs decreased at a 6.0-percent SAAR from December 2004 to June 2005, after declining at a 15.9-percent SAAR during the previous 6-month period. (See table 2.)

The crude energy materials index declined 3.1 percent in June, subsequent to a 1.9-percent decline in May. The natural gas index fell 8.9 percent in June, after decreasing 3.6 percent in the prior month. Prices for coal turned down 1.1 percent, after increasing 0.3 percent a month earlier. By contrast, prices for crude petroleum gained 5.5 percent, following a 0.5-percent rise in May. The index for crude energy materials moved up at a 7.9-percent SAAR from December 2004 to June 2005, after advancing at a 14.6-percent SAAR during the second half of 2004.

Prices for basic industrial materials declined 4.3 percent in June, after falling 3.6 percent in May. The iron and steel scrap index fell 19.9 percent in June, following a 12.3-percent drop in the preceding month. Prices for aluminum base scrap and for softwood logs, bolts, and timber also fell at a faster rate in June, compared to May. Prices for wastepaper declined, after remaining unchanged a month earlier, and the raw cotton index turned down after a May increase. Conversely, the copper ore index increased 6.1 percent in June, after declining 7.7 percent in May. Similarly, prices for copper base scrap and for hides and skins turned up in June, following decreases in May. During the first half of 2005, the index for crude nonfood materials less energy declined at a 21.8-percent SAAR, after advancing at a 41.6-percent SAAR for the second half of 2004.

Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries declined 1.8 percent in June, following a 2.1-percent drop in May. (Net output price indexes are not seasonally adjusted.) Prices fell in June for the industries for natural gas liquid extraction, crude petroleum and natural gas extraction, phosphate rock mining, bituminous coal and lignite surface mining, and gold ore mining. These decreases outweighed rising prices received by the industries for oil and gas operations support activities, copper ore and nickel ore mining, oil and gas well drilling, bituminous coal underground mining, and for crushed and broken limestone mining and quarrying. During the first half of 2005, the Producer Price Index for the Net Output of Total Mining Industries advanced at an annual rate of 8.0 percent, compared with an 18.4-percent rate of increase in the second half of 2004. In June 2005, this index was 175.8 (December 1984=100), 13.1 percent above its year-ago level.

Manufacturing. The Producer Price Index for the Net Output of Total Manufacturing Industries edged up 0.1 percent in June, following a 0.3-percent drop a month earlier. This upturn was primarily due to prices received by the petroleum and coal products manufacturing industry group, which increased 3.2 percent after falling a similar amount in the prior month. The industry group indexes for wood products manufacturing, computer and electronic products, and for printing and related support activities also turned up, compared with declines in May. Prices paid to manufacturers of fabricated metal products, nonmetallic mineral products, and beverage and tobacco products advanced more in June than they did a month earlier. Alternatively, prices received by food manufacturers fell 0.9 percent, after rising 0.4 percent in the previous month. The industry group indexes for transportation equipment and chemical manufacturing industry group remained unchanged, after increasing in May. From December 2004 to June 2005, the Producer Price Index for the Net Output of Total Manufacturing Industries rose at an annual rate of 6.2 percent, following a 3.0-percent rate of increase from June 2004 to December 2004. In June 2005, this index was 149.4 (December 1984=100), 4.5 percent above its year-ago level.

Services. Among services industries in June, prices received by commercial bankers advanced 5.2 percent, after decreasing 3.0 percent in May. The industry indexes for scheduled passenger air transportation and securities brokerages also turned up, following declines in the prior month. Prices received by hotels and motels (excluding casinos) and offices of lawyers increased more in June than they did a month earlier. The index for savings institutions fell less than it did in May. By contrast, rising prices for investment banking and securities dealing slowed, advancing 0.3 percent compared with a 2.7-percent rise in May. The indexes for line-haul railroads and for direct health and medical insurance carriers also increased less in June than they did in the previous month. Prices received by offices of certified public accountants and casino hotels turned down, after increasing in May, while the index for cellular and other wireless carriers fell more during the same period.

Producer Price Index data for July 2005 are scheduled to be released on Wednesday, August 17, 2005, at 8:30 a.m. (EDT).

Technical Note

Brief Explanation of Producer Prices Indexes

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

Stage-of-Processing Indexes

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

Commodity Indexes

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (2-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit). Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

Industry Net-Output Price Indexes

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digits), products (9-digits), and more detailed subproducts (11-digits); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

Data Collection

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of unit dollar prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

		PPI Detailed
Title	Code	Report Issue
	SIC	
Wireless telecommunications	4812	July 1999
Telephone communications, except radio telephone	4813	July 1995
Television broadcasting	4833	July 2002

Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

Price Index Reference Base

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at (http://www.bls.gov/opub/hom/homch14_itc.htm), and reprints are available on request.

Calculating Index Changes

Each PPI measures price changes from a reference period which equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: Prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	34

Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy, because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from the BLS.)

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (6-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

Producer Price Index Data Via the Internet

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million accesses of PPI series over the Internet during the 12 months ended December 31, 2003.

Retrieving PPI data from the PPI Website

PPI data can be obtained from the WWW address (http://www.bls.gov/ppi). Scrolling down the page to the "Get Detailed Statistics" header reveals the following 5 methods of data retrieval:

• *Most Requested Series* is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.

• *Create Customized Tables* is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple screen, nonJava-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.

• *Series Report* is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

There are three basic formats for creating a unique PPI time series identifier. For commodity and stage-of-processing indexes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) in combination with a commodity-based code to create a series identifier.

Commodity code	Will provide data for:
wps063	Drugs and pharmaceuticals, seasonally adjusted
wpu063803	Pharmaceutical preparations, cardiovascular system
wpusop3000	Finished goods, not seasonally adjusted

For a current industry-based price index organized according to the North American Industry Classification System (NAICS), enter the prefix "pcu" followed by the industry-product code. The series identifier for products primary to an industry include 12 numeric digits, the six-digit industry code is repeated, and up to seven additional digits of product detail. Dashes are used as place holders for higher-level industry group codes.

Industry-product code, Current NAICS series	Will provide data for:
pcu325325 pcu336110336110	Chemical manufacturing, not seasonally adjusted Automobile and light duty motor vehicle manufacturing
pcu621111621111411	Offices of physicians, one and two physician practices and single specialty group practices, general/family practice

To identify a discontinued industry-product code based on the Standard Industrial Classification (SIC), enter a "pdu" prefix and "#" between the fourth and fifth characters of the product code. A series identifier for the discontinued dataset uses underscores as placeholders to complete a reference to an SIC industry group code of less than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of the NAICS.) *In all cases, no spaces are permitted.*

Industry-product code,	Will provide data for:
Discontinued SIC series	
pdu28#	Chemicals and allied products, not seasonally adjusted
pdu331_#	Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted
pdu3711#111	Passenger cars

• *Flat Files* and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as, seasonal factor and relative importance tables). The FTP site can be accessed at (**ftp://ftp.bls.gov**) or directly from the links on the "Get Detailed Statistics" page or the PPI homepage. Data and documentation available for download include:

		Directory:
•	NAICS Current Series	/pub/time.series/pc
•	SIC Discontinued Series	/pub/time.series/pd
•	Commodity Series	/pub/time.series/wp
•	Special Requests	/pub/special.requests/ppi
-	Latast Marris Dalassa	/ h /

Latest News Release /pub/news.release/ppi.txt

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /**pub/doc** directory. Within this directory, go to the **overview.txt** file for an overview relating to all BLS data available through the FTP site. For commodity-based PPI data (which appear in tables 1, 2, 3, 6, 7, and 8 of the PPI monthly detailed report and tables 1, 2, 3, and 5 of the monthly news release), the program help file is **wp.txt**. For *current* industry-based PPI data based on the NAICS (which appear in tables 4, 5, and 9 of the monthly PPI report and table 4 of the monthly news release), the file is **pc.txt**. For industry-based SIC time series that have been *discontinued*, go to **pd.txt**. (These and other help files are also maintained within each of the five directories listed above.)

Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (http://www.bls.gov). After clicking the "Get Detailed Statistics" link at the top of the homepage a chart appears listing all of the available BLS programs. The following four methods are available for PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page including: Economic news releases, series report, and economy at a glance.

Additional information

The PPI homepage (http://www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information directly at (202) 691-7705 or *ppi-info@bls.gov*. Data also can be obtained by calling the national fax-on-demand service at (202) 691-6325. This service enables customers to request faxes of BLS data 24 hours a day, 7 days a week.

I/ Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

2/ The indexes for February 2005 have been recalculated to incorporate late reports and corrections by respondents.

All indexes are subject to revision 4 months after original publication.

3/ Not available.

Note: NAICS 2002 replaced the SIC system beginning with the release of PPI data for January 2004.
