USDL 04-2103 TRANSMISSION OF MATERIAL IN THIS RELEASE IS EMBARGOED UNTIL 8:30 A.M. (EDT), FRIDAY, OCTOBER 15, 2004

#### **Producer Price Indexes -- September 2004**

The Producer Price Index for Finished Goods increased 0.1 percent in September, seasonally adjusted, the Bureau of Labor Statistics of the U.S. Department of Labor reported today. This increase followed a 0.1-percent decline in August and a 0.1-percent rise in July. At the earlier stages of processing, prices received by manufacturers of intermediate goods edged up 0.1 percent in September, after a 1.0-percent gain in the preceding month, while the crude goods index fell 4.2 percent, compared with a 0.7-percent decrease in August. (See table A.)

Table A. Monthly and annual percent changes in selected stage-of-processing price indexes, seasonally adjusted

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for May 2004 have been revised to reflect the availability of late reports and corrections by respondents.

Among finished goods, prices for goods other than foods and energy turned up 0.3 percent in September, following a decline of 0.1 percent in the prior month, while the consumer foods index rose 0.1 percent in September, after falling 0.2 percent in August. By contrast, the index for finished energy goods turned down 0.9 percent, compared with a 0.2-percent increase in August.

During the third quarter of 2004, the finished goods index increased at a 0.3-percent seasonally adjusted annual rate, after rising at a 4.7-percent rate during the second quarter of 2004. The index for finished goods other than foods and energy climbed at a 1.1-percent seasonally adjusted annual rate during the third quarter of 2004, compared with a 2.9-percent seasonally adjusted annual rate of increase during the second quarter. Among prices for raw and partially processed goods, the intermediate goods index advanced at a 7.8-percent seasonally adjusted annual rate during the third quarter of 2004, following an 11.7-percent seasonally adjusted annual rate of increase from March 2004 to June 2004. Prices for crude goods decreased at an 18.8-percent seasonally adjusted annual rate from June to September, compared with a 23.2-percent seasonally adjusted annual rate of increase in the preceding quarter. (See summary below.)

Before seasonal adjustment, the Producer Price Index for Finished Goods rose 0.1 percent in September to 148.7 (1982=100). From September 2003 to September 2004, the finished goods index rose 3.3 percent. Over the same period, prices for finished energy goods climbed 9.2 percent, the index for finished consumer foods increased 2.8 percent, and prices for finished goods other than foods and energy advanced 1.9 percent. At the earlier stages of processing, the index for intermediate goods moved up 8.4 percent, and prices for crude goods rose 14.2 percent for the 12-month period ended September 2004.

Summary of December-to-December, 9-month, and 3-month seasonally adjusted annual rates for selected stages of processing

		tage cha	_	Seasonally adjusted annual rate for:

Crude nonfood materials less energy	-9.9	12.6	21.6	18.1	63.1	-32.8	50.3	

NOTE: Late reports and corrections by respondents may cause some indexes to change 4 months after original publication. In addition, seasonally adjusted indexes may be revised for 5 years due to the recalculation of seasonal factors each January.

#### Finished goods

The index for finished consumer goods other than foods and energy rose 0.4 percent in September, after declining 0.2 percent in August. The upturn in this index was led by an increase in motor vehicle prices in September. The light motor trucks index increased 0.2 percent, after falling 2.5 percent in August, and passenger car prices rose 1.1 percent in September, following a 1.2-percent decrease in the prior month. The indexes for sanitary papers and health products and household appliances also turned up in September. Prices for mobile homes and women's, girls', and infants' apparel rose more in September than they did in August. The index for cosmetics and other toilet preparations showed no change in September, compared with a decline in the previous month. Conversely, the alcoholic beverages index showed no change in September, after rising 1.3 percent in August. Prices for pharmaceutical preparations and household furniture rose less in September than they did in the prior month. The index for pet food turned down, following an increase in August. From June 2004 to September 2004, the index for finished consumer goods other than foods and energy rose at a 1.0-percent seasonally adjusted annual rate, after increasing at a 2.3-percent seasonally adjusted annual rate from March 2004 to June 2004.

r=revised. Some of the figures shown above and elsewhere in this release may differ from those previously reported because data for May 2004 have been revised to reflect the availability of late reports and corrections by respondents.

Subsequent to a 0.1-percent decrease in August, capital equipment prices rose 0.4 percent in September. As they did in the index for consumer goods other than foods and energy, prices for motor vehicles led the turnaround in the capital equipment index. The indexes for both light motor trucks and passenger cars increased in September, after falling in August. Prices for x-ray and electromedical equipment also turned up in September, and the index for communication and related equipment advanced at a faster pace in September than it did in August. On the other hand, prices for civilian aircraft showed no change, compared with a 1.4-percent increase in the prior month. The indexes for commercial furniture and railroad equipment fell, after rising in the previous month. Price increases slowed from August to September for heavy motor trucks. From June 2004 to September 2004, capital equipment prices rose at a 1.4-percent seasonally adjusted annual rate, after a 3.5-percent seasonally adjusted annual rate of increase from March 2004 to June 2004.

The finished consumer foods index edged up 0.1 percent in September, after a 0.2-percent decline in August. Prices for fresh fruits and melons jumped 23.1 percent in September, compared with a 1.2-percent decrease in the prior month. The index for eggs for fresh use also turned up in September. The rate of decline in prices for dairy products and beef and veal slowed from August to September. By contrast, the fresh and dry vegetables index rose 12.1 percent, following a 31.8-percent advance in the previous month. The indexes for soft drinks, finfish and shellfish, pork, and shortening and cooking oils declined, after posting increases in August. During the third quarter of 2004, the index for finished consumer foods decreased at a 6.8-percent seasonally adjusted annual rate, after advancing at an 8.5-percent seasonally adjusted annual rate in the second quarter of 2004.

The finished energy goods index declined 0.9 percent in September, following a 0.2-percent increase in the prior month. Residential natural gas prices fell 2.3 percent, after rising 1.1 percent in August. The indexes for liquefied petroleum gas, home heating oil, residential electric power, and diesel fuel also turned down in September. On the other hand, gasoline prices turned up 0.7 percent, compared with a decrease of 5.0 percent in August. During the third quarter of 2004, the index for finished energy goods increased at a 6.3-percent seasonally adjusted annual rate, after advancing at a 6.4-percent seasonally adjusted annual rate during the second quarter of 2004.

#### **Intermediate goods**

The Producer Price Index for Intermediate Materials, Supplies, and Components inched up 0.1 percent in September, after posting a 1.0-percent gain in the previous month. Rising prices for nondurable manufacturing materials, durable manufacturing materials, and materials and components for construction slightly outweighed price declines for intermediate energy goods and intermediate foods and feeds. Excluding foods and energy, prices for intermediate goods rose 0.7 percent, following a 1.0-percent increase in August. (See table B.)

The index for materials for nondurable manufacturing advanced 1.7 percent in September, the same rate of increase as in August. In September, rising prices were received by producers of plastic resins and materials, primary basic organic chemicals, paper, potassium and sodium compounds, fertilizer materials, and synthetic rubber. These increases more than offset falling prices for gray fabrics, inedible fats and oils, intermediate basic organic chemicals, finished fabrics, medicinal and botanical chemicals, and leather. The index for nondurable manufacturing materials moved up at a 19.4-percent seasonally adjusted annual rate from June 2004 to September 2004, following a 12.7-percent seasonally adjusted annual rate of increase in the second quarter of 2004.

Prices for materials for durable manufacturing climbed 1.5 percent in September, following a 1.1-percent increase in the preceding month. The index for aluminum mill shapes jumped 6.4 percent, after edging up 0.2 percent a month earlier. Prices for hot rolled steel sheet and strip fell less in September than they did in August, while the indexes for semi-finished steel mill products and for cold rolled steel sheet and strip increased more rapidly over the same period. Prices for unprocessed filament yarns turned up in September, after decreasing in the previous month. On the other hand, the index for hot rolled steel bars, plates, and structural shapes moved up 1.1 percent, following a 10.3-percent advance in August. Rising prices for plywood, building paper and board, cold finished steel bars, cement, and hardwood lumber also slowed from August to September. The index for materials for durable manufacturing advanced at a 15.1-percent seasonally adjusted annual rate in the third quarter of 2004, following a 21.4-percent seasonally adjusted annual rate of increase in the previous quarter.

Rising prices for materials and components for construction slowed to 0.7 percent in September, compared with a 1.4-percent gain in the prior month. The index for fabricated structural metal products inched up 0.2 percent, following a 1.7-percent gain in August. The indexes for plywood, treated wood, building paper and board, and steel mill products also increased at a slower rate in September than they did a month earlier. Prices for softwood lumber and nonferrous wire and cable declined, after rising in the previous month. By contrast, prices for concrete products climbed 1.7 percent in September, following a 0.9-percent rise in the preceding month. The indexes for plastic construction products, wiring devices, paving mixtures and blocks, and switchgear also rose more quickly in September than they did in August. Prices for asphalt felts and coatings increased, after showing no change in the previous month. The index for plumbing fixtures and brass fittings turned up, following a decrease in August. Prices for materials and components for construction grew at a 9.7-percent seasonally adjusted annual rate during the third quarter of 2004, after increasing at a 13.2-percent seasonally adjusted annual rate during the preceding quarter.

The index for intermediate energy goods fell 1.9 percent in September, following a 2.7-percent increase in the prior month. Industrial natural gas prices dropped 4.9 percent, compared with a 3.7-percent gain in August. The indexes for jet fuels, diesel fuel, industrial electric power, commercial natural gas, and liquefied petroleum gas also turned down, after rising in August. Alternatively, gasoline prices advanced 0.7 percent in September, following a 5.0-percent decline a month earlier. The index for finished lubricants also turned up in September. The intermediate energy goods index increased at a 13.1-percent seasonally adjusted annual rate during the third quarter of 2004, after rising at a 17.5-percent seasonally adjusted annual rate in the previous quarter.

The rate of decline in the index for intermediate foods and feeds slowed from August to September -- falling 5.2 and 1.7 percent, respectively. Prices for prepared animal feeds decreased 3.0 percent, compared with a 10.1-percent drop in the prior month. The indexes for fluid milk products; beef and veal; and dry, condensed, and evaporated milk products also fell less in September than they did August. Flour prices advanced in September, after declining a month earlier. By contrast, prices for shortening and cooking oils dropped 3.3 percent in September, following a 3.0-percent gain in the preceding month. The indexes for natural, processed, and imitation cheese; pork; and refined sugar and byproducts also turned down, after rising in the previous month. Prices for processed young chickens fell more in September than they did in August. The index for intermediate foods and feeds declined at a 28.6-percent seasonally adjusted annual rate from June 2004 to September 2004, compared with a 23.0-percent seasonally adjusted annual rate of increase during the second quarter of 2004.

#### Crude goods

The Producer Price Index for Crude Materials for Further Processing fell 4.2 percent in September, following a 0.7-percent decline in August. Prices for crude energy materials also decreased more in September than they did in the prior month, while an August increase in the index for crude goods other than foods and energy was followed by a decline in September. By contrast, prices for crude foodstuffs and feedstuffs fell less in September than they did a month earlier. (See table B.)

The crude energy materials index decreased 6.6 percent in September, after edging down 0.1 percent in the preceding month. Prices for crude petroleum declined 0.3 percent, following a 12.5-percent jump in August. The index for natural gas tumbled 12.4 percent, compared with a 6.7-percent decline in the previous month. On the other hand, coal prices climbed 2.9 percent in September, after inching up 0.1 percent in the prior month. After rising at an 83.2-percent seasonally adjusted annual rate during the second quarter of 2004, the index for crude energy materials fell at a 23.8-percent seasonally adjusted annual rate from June to September.

Prices for basic industrial materials moved down 2.5 percent in September, following a 4.5-percent advance in the previous month. The index for iron and steel scrap fell 8.7 percent, after posting a 7.7-percent gain in August. Prices for aluminum base scrap, copper base scrap, and wastepaper also turned down in September, following increases in the prior month. The hides and skins index went up less than it did in the preceding month. Alternatively, raw cotton prices jumped 11.7 percent in September, compared with a 3.0-percent decrease a month earlier. The indexes for gold ores and pulpwood also turned up in September, while prices for softwood logs, bolts, and timber showed no change, after falling in August. During the third quarter of 2004, the index for crude nonfood materials less energy rose at a 50.3-percent seasonally adjusted annual rate, following a 32.8-percent seasonally adjusted annual rate of decline during the previous calendar quarter.

Prices for crude foodstuffs and feedstuffs went down 2.1 percent in September, after falling 4.6 percent in the preceding month. The main cause of this index's movement was the slowing rate of decline in prices for soybeans -- which decreased 3.1 percent in September following a 35.5-percent decline in August. The indexes for fluid milk and corn also fell less than they did in the previous month, while prices for wheat and fresh fruits and melons turned up in September. By contrast, the index for slaughter broilers and fryers dropped 13.7 percent in September, following a 4.0-percent decline in the prior month. The indexes for fresh vegetables (except potatoes) and unprocessed finfish rose less than they did in August, and prices for slaughter cattle and slaughter hogs turned down in September. Prices for crude foodstuffs and feedstuffs decreased at a 37.5-percent seasonally adjusted annual rate for the three months ending in September 2004, compared with a 9.7-percent seasonally adjusted annual rate of increase in the preceding quarter.

#### Net output price indexes for mining, manufacturing, and services industries

Mining. The Producer Price Index for the Net Output of Total Mining Industries declined 5.3 percent in September, following a 1.3-percent rise in August. (Net output price indexes are not seasonally adjusted.) Most of this downturn can be traced to prices received by the industry for natural gas liquid extraction, which fell 13.9 percent in September after advancing 2.2 percent in the preceding month. The industry indexes for crude petroleum and natural gas extraction and for potash, soda, and borate minerals mining also moved down, following August gains. Prices received by the industries for oil and gas well drilling and miscellaneous metal ores mining increased at a slower rate in September than they did in the prior month. By contrast, the index for the bituminous coal and lignite surface mining industry jumped 5.8 percent, compared with a 0.3-percent rise in August. Prices received by the industries for oil and gas operations support activities, bituminous coal underground mining, and construction sand and gravel mining also advanced at a quicker rate in September than they did a month earlier. The index for the gold ore mining industry turned up, after falling in August. For the 3 months ended September 2004, the Producer Price Index for the Net Output of Total Mining Industries declined at an annual rate of 12.4 percent, compared with a 60.7-percent rate of increase for the preceding calendar quarter. In September 2004, this index was 148.8 (December 1984=100), 19.3 percent above its year-ago level.

*Manufacturing.* The Producer Price Index for the Net Output of Total Manufacturing Industries climbed 0.3 percent in September, following a 0.2-percent gain in August. In September, manufacturers of chemicals, petroleum and coal products, plastics and rubber products, primary metals, nonmetallic mineral products, electrical equipment and appliances, and paper products collected higher prices. On the other hand, prices received by food manufacturers, textile mills, and beverage and tobacco product makers fell in September. From June 2004 to September 2004, the Producer Price Index for the Net Output of Total Manufacturing Industries increased at an annual rate of 3.1 percent, after rising at a 7.9-percent rate from March to June. In September 2004, this index was 144.1 (December 1984=100), 5.1 percent above its year-ago level.

Services. Among services industries, prices received by the scheduled passenger air transportation industry dropped 3.4 percent in September, following a 1.4-percent advance in August. The industry indexes for investment bankers and securities dealers, lessors of nonresidential buildings (excluding miniwarehouses), wired telecommunications carriers, casino hotels, and passenger car rental also turned down in September, after rising a month earlier. Prices received by hotels (excluding casino hotels) and motels fell at a quicker pace than they did in August. By contrast, the industry index for securities brokerages increased 0.7 percent in September, compared with a 3.3-percent decrease in the prior month. Prices received by general medical and surgical hospitals and television broadcasters also turned up, following August declines, while the industry index for portfolio managers rose at a faster rate in September than it did in the preceding month.

\*\*\*\*

Producer Price Index data for October 2004 are scheduled to be released on Tuesday, November 16, 2004, at 8:30 a.m. (EST).

#### **Brief Explanation of Producer Prices Indexes**

The Producer Price Index (PPI) of the Bureau of Labor Statistics (BLS) is a family of indexes that measure the average change over time in the prices received by domestic producers of goods and services. PPIs measure price change from the perspective of the seller. This contrasts with other measures, such as the Consumer Price Index (CPI). CPIs measure price change from the purchaser's perspective. Sellers' and purchasers' prices can differ due to government subsidies, sales and excise taxes, and distribution costs.

More than 8,000 PPIs for individual products and groups of products are released each month. PPIs are available for the products of virtually every industry in the mining and manufacturing sectors of the U.S. economy. New PPIs are gradually being introduced for the products of industries in the trade, finance, and services sectors of the economy.

More than 100,000 price quotations per month are organized into three sets of PPIs: (1) Stage-of-processing indexes; (2) commodity indexes; and (3) indexes for the net output of industries and their products. The stage-of-processing structure organizes products by class of buyer and degree of fabrication. The commodity structure organizes products by similarity of end use or material composition. The entire output of various industries is sampled to derive price indexes for the net output of industries and their products.

#### **Stage-of-Processing Indexes**

Within the stage-of-processing system, finished goods are commodities that will not undergo further processing and are ready for sale to the final-demand user, either an individual consumer or business firm. Consumer foods include unprocessed foods such as eggs and fresh vegetables, as well as processed foods such as bakery products and meats. Other finished consumer goods include durable goods such as automobiles, household furniture, and appliances, as well as nondurable goods such as apparel and home heating oil. Capital equipment includes producer durable goods such as heavy motor trucks, tractors, and machine tools.

The stage-of-processing category for intermediate materials, supplies, and components consists partly of commodities that have been processed but require further processing. Examples of such semifinished goods include flour, cotton yarn, steel mill products, and lumber. The intermediate goods category also encompasses nondurable, physically complete items purchased by business firms as inputs for their operations. Examples include diesel fuel, belts and belting, paper boxes, and fertilizers.

Crude materials for further processing are products entering the market for the first time that have not been manufactured or fabricated and that are not sold directly to consumers. Crude foodstuffs and feedstuffs include items such as grains and livestock. Examples of crude nonfood materials include raw cotton, crude petroleum, coal, hides and skins, and iron and steel scrap.

#### **Commodity Indexes**

The commodity classification structure of the PPI organizes products by similarity of end use or material composition, disregarding industry of origin. Fifteen major commodity groupings (2-digit commodity codes) make up the All Commodities Index. Each major commodity grouping includes (in descending order of aggregation) subgroups (3-digit), product classes (4-digit), subproduct classes (6-digit), and individual items (8-digit). Nearly all 8-digit commodities under the traditional commodity coding system are now derived from corresponding industry-classified product indexes. In such instances, movements in the traditional commodity price indexes and corresponding percent changes will be virtually identical to their industry-based counterparts, even if their index levels differ.

#### **Industry Net-Output Price Indexes**

PPIs for the net output of industries and their products are grouped according to the North American Industry Classification System (NAICS). Prior to the release of January 2004, industry-based PPIs were published according to the Standard Industrial Classification (SIC) system. Industry price indexes are compatible with other economic time series organized by industry, such as data on employment, wages, and productivity. Table 5 of the *PPI Detailed Report* includes data for NAICS industries and industry groups (3-, 4-, 5-, and 6-digit codes); Census product classes (7- and 8-digits), products (9-digits), and more detailed subproducts (11-digits); and, for some industries, indexes for other sources of revenue.

Indexes may represent one of three kinds of product indexes. Every industry has primary product indexes to show changes in prices received by establishments classified in the industry for products made primarily, but not necessarily exclusively, by that industry. The industry classification of an establishment is determined by which products comprise a plurality of its total shipment value. In addition, most industries have secondary product indexes that show changes in prices received by establishments classified in the industry for products chiefly made in some other industry. Finally, some industries have miscellaneous receipts indexes to show price changes in other sources of revenue received by establishments within the industry that are not derived from sales of their products, for example, resales of purchased materials, or revenues from parking lots owned by a manufacturing plant.

#### **Data Collection**

PPIs are based on selling prices reported by establishments of all sizes selected by probability sampling, with the probability of selection proportionate to size. Individual items and transaction terms from these firms are also chosen by probability proportionate to size. The BLS strongly encourages cooperating companies to supply actual transaction prices at the time of shipment to minimize the use of list prices. Prices submitted by survey respondents are effective on the Tuesday of the week containing the 13th day of the month. This survey is conducted primarily through the mail.

Price data are provided on a voluntary and confidential basis; only sworn BLS employees are allowed access to individual company price reports. BLS publishes price indexes instead of unit dollar prices. All PPIs are subject to revision 4 months after original publication to reflect the availability of late reports and corrections by respondents.

BLS periodically updates the PPI sample of survey respondents to better reflect current conditions when the structure, membership, technology, or product mix of an industry shifts significantly and to spread reporting burden among smaller firms. Results of these resampling efforts are incorporated into the PPI with the release of data for January and July.

As part of an ongoing effort to expand coverage to sectors of the economy other than mining and manufacturing, an increasing number of service sector industries have been introduced into the PPI. The following list of recently introduced industries includes the month and year in which an article describing the industry's content appeared in the *PPI Detailed Report*.

PPI Detailed

		PPI Detailed
Title	Code	Report Issue
	SIC	
Wireless telecommunications	4812	July 1999

#### Weights

Weights for most traditional commodity groupings of the PPI, as well as weights for commodity-based aggregate indexes calculated using traditional commodity groupings, such as stage-of-processing indexes, currently reflect 1997 values of shipments as reported in the *Census of Manufactures* and other sources. From January 1996 through December 2001, PPI weights were derived from 1992 shipment values. Industry indexes also are now calculated with 1997 net output weights. This periodic update of the value weights used to calculate the PPI is done to more accurately reflect changes in production and marketing patterns in the economy. Net output values of shipments are used as weights for industry indexes. Net output values refer to the value of shipments from establishments within the industry to buyers outside the industry. However, weights for commodity price indexes are based on gross shipment values, including shipment values between establishments within the same industry. As a result, broad commodity grouping indexes, such as the PPI for All Commodities, are affected by the multiple counting of price change at successive stages of processing, which can lead to exaggerated or misleading signals about inflation. Stage-of-processing indexes partially correct this defect, but industry indexes consistently correct for this at all levels of aggregation. Therefore, industry and stage-of-processing indexes are more appropriate than broad commodity groupings for economic analysis of general price trends.

#### **Price Index Reference Base**

Effective with publication of January 1988 data, many important PPI series (including stage-of-processing groupings and most commodity groups and individual items) were placed on a new reference base, 1982=100. From 1971 through 1987, the standard reference base for most PPI series was 1967=100. Except for rounding differences, the shift to the new reference base did not alter any previously published percent changes for affected PPI series. (See "Calculating Index Changes," below.) The 1982 reference base is not used for commodity indexes with a base later than December 1981 or for industry net output indexes and their products.

For further information on the underlying concepts and methodology of the Producer Price Index, see chapter 14, "Producer Prices," in *BLS Handbook of Methods* (April 1997), Bulletin 2490. This document can be downloaded from the BLS Web site at (http://www.bls.gov/opub/hom/homch14 itc.htm), and reprints are available on request.

#### **Calculating Index Changes**

Each PPI measures price changes from a reference period which equals 100.0. An increase of 5.5 percent from the reference period in the Finished Goods Price Index, for example, is shown as 105.5. This change also can be expressed in dollars, as follows: Prices received by domestic producers of a sample of finished goods have risen from \$100 in 1982 to \$105.50. Likewise, a current index of 90.0 would indicate that prices received by producers of finished goods are 10 percent lower than they were in 1982.

Movements of price indexes from one month to another are usually expressed as percent changes, rather than as changes in index points. Index point changes are affected by the level of the index in relation to its base period, whereas percent changes are not. The following example shows the computation of index point and percent changes.

Index point change	
Finished Goods Price Index	107.5
Less previous index	104.0
Equals index point change	3.5
Index percent change	
Index point change	3.5
Divided by the previous index	104.0
Equals	0.034
Result multiplied by 100	0.034 x 100
Equals percent change	3.4

#### Seasonally Adjusted and Unadjusted Data

Because price data are used for different purposes by different groups, BLS publishes seasonally adjusted and unadjusted changes each month. Seasonally adjusted data are preferred for analyzing general price trends in the economy, because these data eliminate the effect of changes that normally occur at about the same time, and in about the same magnitude, every year—such as price movements resulting from normal weather patterns, regular production and marketing cycles, model changeovers, seasonal discounts, and holidays. For these reasons, seasonally adjusted data more clearly reveal underlying cyclical trends. Unadjusted data are of primary interest to users who need information that can be related to actual dollar values of transactions. Individuals requiring this information include marketing specialists, purchasing agents, budget and cost analysts, contract specialists, and commodity traders. It is the unadjusted data that are generally cited when escalating long-term contracts such as purchasing agreements or real estate leases. (See *Escalation and Producer Price Indexes: A Guide for Contracting Parties*, BLS Report 807, September 1991, available on request from the BLS.)

In 1998, the PPI implemented the X-12-ARIMA Seasonal Adjustment Method; prior to that year the PPI employed the X-11 method. Each year, the seasonal status of most commodity indexes is re-evaluated to reflect more recent price behavior. Industry net output indexes are not seasonally adjusted. For time series that exhibit seasonal pricing patterns, new seasonal factors are estimated and applied to the unadjusted data for the previous 5 years. These updated seasonally adjusted indexes replace the most recent 5 years of seasonal data.

Seasonal factors may be applied to series using either a direct or aggregative method. Generally, commodity indexes are seasonally adjusted using direct seasonal adjustment, which produces a more complete elimination of seasonal movements than the aggregative method. However, the direct seasonal adjustment process may not yield figures that possess additive consistency. Thus, a seasonally adjusted index for a broad category that is directly adjusted may not be logically consistent with all seasonally adjusted indexes for its components. Seasonal movements for stage-of-processing indexes are derived indirectly through an aggregative method that combines movements of a wide variety of subproduct class (6-digit) series.

Seasonally adjusted indexes can become problematic when previously stable and predictable price patterns abruptly change. If the new pattern persists, the seasonal adjustment method will eventually reflect it adequately; if these patterns keep shifting, however, seasonally adjusted data will become chronically troublesome. This problem occurs relatively infrequently for farm and food-related products but has more often affected manufactured products such as automobiles and steel.

Since January 1988, the PPI has used Intervention Analysis Seasonal Adjustment methods to enhance the calculation of seasonal factors. With this technique, outlier values that may distort the seasonal pattern are removed from the data prior to applying the standard seasonal factor estimation procedure. For example, a possible economic cause for large price movements for petroleum-based products might have been the Persian Gulf War. In this case, intervention techniques allowed for better estimates of seasonally adjusted data. On the whole, very few series have required intervention. Out of nearly 900 seasonally adjusted series, only 16 interventions were performed in 1997.

For more information relating to seasonal adjustment methods, see (1) "Appendix A: Seasonal Adjustment Methodology at BLS," in the *BLS Handbook of Methods* (April 1997), Bulletin 2490 and (2) "Summary of Changes to the PPI's Seasonal Adjustment Methodology" in the January 1995 issue of *Producer Price Indexes*.

#### **Producer Price Index Data Via the Internet**

In 1995, the BLS began posting PPI series, news releases, and technical information to both a World Wide Web (WWW) site and a file transfer protocol (FTP) site. During the years following the introduction of PPI Internet services, usage of these sites eclipsed more traditional methods of data dissemination, such as subscriptions to the *PPI Detailed Report*. There were more than 1.6 million accesses of PPI series over the Internet during the 12 months ended December 31, 2003.

#### Retrieving PPI data from the PPI Website

PPI data can be obtained from the WWW address (http://www.bls.gov/ppi). Scrolling down the page to the "Get Detailed Statistics" header reveals the following 5 methods of data retrieval:

- *Most Requested Series* is a form-based application that allows the user to quickly obtain PPI time series data by selecting from two separate lists (commodity and industry) of the most commonly requested time series, including the All Commodities Index and the stage-of-processing indexes (for example, Finished Goods). Within each list, any one—or all—of the time series shown can be selected. A user can modify the date range and output options after executing the query, using the reformat button above the data output table.
- Create Customized Tables is a form-based query application designed for users unfamiliar with the PPI coding structure. It guides a user through the PPI classification system by listing index titles and does not require knowledge of commodity or industry codes. Data retrieved are based on a query formulated by selecting data characteristics from lists provided. Two options are available to create customized tables, depending on a user's browser capability. The one-screen option is a JavaScript application that uses a single screen to guide a user through the available time series data. The second option is a multiple screen, nonJava-based application. Both methods allow a user to browse the PPI coding structure and select multiple series codes. Using the one-screen option, users can modify the date range and output options after executing the query using the reformat button above the data output table.
- **Series Report** is a form-based application that uses formatted PPI time series identifiers (commodity or industry codes) as input in extracting data according to a specified set of date ranges and output options. This application provides the most efficient path for those users who are familiar with the format of PPI time series identifiers. Up to 300 indexes can be extracted at one time.

There are three basic formats for creating a unique PPI time series identifier. For commodity and stage-of-processing indexes, enter a "wpu" prefix (not seasonally adjusted) or a "wps" prefix (seasonally adjusted) in combination with a commodity-based code to create a series identifier.

Commodity code wps063 wpu063803

wpusop3000

Will provide data for:
Drugs and pharmaceut

Drugs and pharmaceuticals, seasonally adjusted Pharmaceutical preparations, cardiovascular system Finished goods, not seasonally adjusted For a current industry-based price index organized according to the North American Industry Classification System (NAICS), enter the prefix "pcu" followed by the industry-product code. The series identifier for products primary to an industry include 12 numeric digits, the six-digit industry code is repeated, and up to seven additional digits of product detail. Dashes are used as place holders for higher-level industry group codes.

Industry-product code,	Will provide data for:
Current NAICS series	
pcu325325	Chemical manufacturing, not seasonally adjusted
pcu336110336110	Automobile and light duty motor vehicle manufacturing
pcu621111621111411	Offices of physicians, one and two physician practices and single specialty group practices,
_	general/family practice

To identify a discontinued industry-product code based on the Standard Industrial Classification (SIC), enter a "pdu" prefix and "#" between the fourth and fifth characters of the product code. A series identifier for the discontinued dataset uses underscores as placeholders to complete a reference to an SIC industry group code of less than four digits. (All PPI industry-based indexes organized by SIC were discontinued with the introduction of the NAICS.) *In all cases, no spaces are permitted.* 

Industry-product code,	Will provide data for:
Discontinued SIC series	
pdu28#	Chemicals and allied products, not seasonally adjusted
pdu331_#	Blast furnaces, steel works, and rolling and finishing mills, not seasonally adjusted
ndu3711#111	Passenger cars

• *Flat Files* and the FTP server are best suited for those users requiring access to either a large volume of time series data or other PPI-related documentation (such as, seasonal factor and relative importance tables). The FTP site can be accessed at (ftp://ftp.bls.gov) or directly from the links on the "Get Detailed Statistics" page or the PPI homepage. Data and documentation available for download include:

Directory:
NAICS Current Series
SIC Discontinued Series
Commodity Series
pub/time.series/pd
pub/time.series/wp
pub/time.series/wp
pub/special.requests/ppi
Latest News Release
pirectory:
pub/time.series/pd
pub/time.series/wp
pub/special.requests/ppi
pub/news.release/ppi.txt

The FTP site maintains files to help with searches and downloads. These files are centrally located in the /pub/doc directory. Within this directory, go to the overview.txt file for an overview relating to all BLS data available through the FTP site. For commodity-based PPI data (which appear in tables 1, 2, 3, 6, 7, and 8 of the PPI monthly detailed report and tables 1, 2, 3, and 5 of the monthly news release), the program help file is wp.txt. For current industry-based PPI data based on the NAICS (which appear in tables 4, 5, and 9 of the monthly PPI report and table 4 of the monthly news release), the file is pc.txt. For industry-based SIC time series that have been discontinued, go to pd.txt. (These and other help files are also maintained within each of the five directories listed above.)

#### Other Sources of PPI Data

PPI data can also be accessed via the BLS homepage (http://www.bls.gov). After clicking the "Get Detailed Statistics" link at the top of the homepage a chart appears listing all of the available BLS programs. The following four methods are available for PPI data: Most requested statistics, create customized tables (one screen or multiple screens), and flat files. Additional sources of BLS data also are accessible from this page including: Economic news releases, series report, and economy at a glance.

#### Additional information

The PPI homepage (http://www.bls.gov/ppi) contains additional information regarding PPI data and methodology. The top section of the homepage provides PPI news releases, both current and archived, as well as general PPI information. The "Tables Created by BLS" section found beneath the statistics section provides relative importance and seasonal factor tables. The remaining sections offer special notices and publications pertaining to PPI methodology and applications.

For questions or comments regarding PPI data classification, methodology, or data availability on the Internet, call or e-mail the Section of Index Analysis and Public Information directly at (202) 691-7705 or *ppi-info@bls.gov*. Data also can be obtained by calling the national fax-on-demand service at (202) 691-6325. This service enables customers to request faxes of BLS data 24 hours a day, 7 days a week.

<sup>1/</sup> Indexes in this table are derived from the net-output-weighted industry price indexes. Because of differences in coverage and aggregation methodology, they will generally not match the movements of similarly titled indexes which are derived from traditional commodity groupings.

Note: NAICS 2002 replaced the SIC system beginning with the release of PPI data for January 2004.

<sup>2/</sup> The indexes for May 2004 have been recalculated to incorporate late reports and corrections by respondents.

All indexes are subject to revision 4 months after original publication.

<sup>3/</sup> Not available.
